

Throughout my time in the Computer Science program at SNHU, I built a lot of different things across a wide range of subjects, and looking back at all of it, I can see how much I have grown as a developer. I started with no real direction in computer science, but as I went through the program, I worked on projects that covered system design, software testing, 3D graphics, database development, full-stack web applications, and artificial intelligence, and each one taught me something different about how to think through a problem and build something that actually works. In CS 255 I designed a full system for a driving preparation company using UML diagrams, in CS 320 I built automated unit testing frameworks to catch bugs early, in CS 340 I connected a Python module to a MongoDB database to power a data dashboard for a rescue organization, in CS 370 I trained a reinforcement learning AI agent, in CS 465 I built a full stack travel website with a REST API and JWT login security, and in CS 360 and CS 499 I built the Anaconda Gym Management Android app from the ground up which became the project I am most proud of because it combines everything I learned into one real product.

What I think makes me stand out is that I know exactly what kind of software I want to build and why. During this program, I realized I want to combine my background in computer science with my passion for BJJ and MMA to create gym management applications for martial arts gyms, and the Anaconda app is the first step toward that. I am comfortable working in Java, Python, JavaScript, and SQL. I have experience with Android Studio, MongoDB, and RESTful API design, and I know how to take a project from an idea on paper all the way to a working app. I care about writing clean code, building things that are secure, and making software that is actually useful to the people who are going to use it. I am looking to join a team where I can keep learning and start contributing real work from day one.
